

Best Management Practices for Herbicide Resistance

- 1 Understand the biology of the weeds present.

- 2 Use a diversified approach toward weed management. Focus on preventing weed-seed production and reducing the number of weed seeds in the soil seedbank.

- 3 Plant into weed-free fields and then keep fields as weed-free as possible.

- 4 Plant weed-free crop seed.

- 5 Scout fields routinely.

- 6 Use multiple herbicide modes of action (MOAs) that are effective against the most troublesome weeds or those most prone to herbicide resistance.

- 7 Apply the labeled herbicide rate at recommended weed sizes.

- 8 Emphasize cultural practices that suppress weeds by using crop competitiveness, meaning rapid-growing bushy crops do a better job of suppressing weeds than slow-growing upright crops that produce few leaves.

- 9 Use mechanical and biological management practices where appropriate.

- 10 Prevent field-to-field and within-field movement of weed seed or vegetative reproductive structures.

- 11 Manage weed seed at harvest and after harvest to prevent a buildup of the weed seedbank.

- 12 Prevent an influx of weeds into the field by managing field borders.
